AWS Transit Gateway connects VPCs and on-premises networks through a main hub. This simplifies your network and puts an end to complex interconnection relationships. It acts like a router in the cloud: each new connection is made only once.

As it expands globally, the interconnection between regions connects AWS Transit Gateways through the AWS global network. Your data is automatically encrypted and never travels over the public Internet. And because of its central position, the AWS Transit Gateway Network Manager has a single view of your entire network, even connecting to software-defined wide area network (SD-WAN) devices.
